DETAILED ACTION

Reason for Allowance

1. The following is an examiner's statement of reasons for allowance: Claims 1, 10 and 20-25 are allowed.

The present invention is directed to the compressed mode configuration in a mobile radio system in which a compressed mode configuration is chosen from a set of reference compressed mode configurations defined by compressed mode parameters including a transmission gap length TGL and a transmission gap pattern length TGPL, the transmission gaps are defined in a first transmission time structure specific to a first system and are determined relative to a second transmission time structure specific to a second system to enable the first system to effect measurements on the second system.

Regarding claim 1, a compressed mode configuration method in a mobile radio system, said method comprising: choosing a compressed mode configuration from a set of reference compressed mode configurations, the compressed mode configuration being defined by compressed mode parameters including a transmission gap length TGL and a transmission gap pattern length TGPL, by a processor, wherein transmission gaps are defined in a first transmission time structure specific to a first system corresponding to Universal Mobile Telecommunications System (UMTS) and determined relative to a second transmission time structure specific to a second system corresponding to Global System for Mobile communications (GSM), to enable

measurements on the second system to be effected in the first system, and the compressed mode parameters are determined so that, for each reference configuration, if the transmission gap pattern length TGPL is a multiple of 6, the transmission gap length TGL is equal to 14, otherwise the transmission gap pattern length TGPL is not a multiple of 6, or otherwise a transmission gap pattern comprises a plurality of transmission gaps.

Regarding claim 10, a network equipment for a mobile radio system, the network equipment comprising: means for choosing a compressed mode configuration from a set of reference configurations, the compressed mode configuration being defined by compressed mode parameters including a transmission gap length TGL and a transmission gap pattern length TGPL, wherein transmission gaps are defined in a first transmission time structure specific to a first system corresponding to Universal Mobile Telecommunications System (UMTS) and determined relative to a second transmission time structure specific to a second system corresponding to Global System for Mobile communications (GSM), to enable measurements on the second system to be effected in the first system, and the compressed mode parameters of each reference configuration are determined so that, if the transmission gap pattern length TGPL is a multiple of 6, the transmission gap length TGL is equal to 14, otherwise the transmission gap pattern length TGPL is not a multiple of 6, or otherwise a transmission gap pattern comprises a plurality of transmission gaps.

Regarding claim 22, a compressed mode configuration method in a mobile radio system, the method comprising: choosing a compressed mode configuration from a set

of reference compressed mode configurations, the compressed mode configuration being defined by compressed mode parameters including a transmission gap length TGL and a transmission gap pattern length TGPL, by a processor, wherein transmission gaps are defined in a first transmission time structure specific to a first system corresponding to Universal Mobile Telecommunications System (UMTS) and determined relative to a second transmission time structure specific to a second system corresponding to Global System for Mobile communications (GSM), to enable measurements on the second system to be effected in the first system, and the compressed mode parameters are determined so that, for at least one reference configuration, the transmission gap pattern length TGPL is equal to 13 and the transmission gap length TGL is equal to 10.

Regarding claim 24, a network equipment for a mobile radio system, the network equipment comprising: means for choosing a compressed mode configuration from a set of reference configurations, the compressed mode configuration being defined by compressed mode parameters including a transmission gap length TGL and a transmission gap pattern length TGPL, wherein transmission gaps are defined in a first transmission time structure specific to a first system corresponding to Universal Mobile Telecommunications System (UMTS) and determined relative to a second transmission time structure specific to a second system corresponding to Global System for Mobile communications (GSM), to enable measurements on the second system to be effected in the first system, and the compressed mode parameters are determined so that, for at

least one reference configuration, the transmission gap pattern length TGPL is equal to 13 and the transmission gap length TGL is equal to 10.

Claims 20, 21, 23 and 25 are allowed since they depend on claim 1, 10, 22 and 24 respectively.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
